```

1) VBScript

```
1  ' CS301
2  ' Thomas Crow
3  '
4  ' Requirements
5  ' function f() {
6  '   write('I have been evaluated');
7  '   return(1); }
8  ' main()
9  ' {
10 '   int i=1; if ( i ==0 && f() ) then write ('true') else write ('false') }
11
12
13 Option Explicit
14
15 'Function f()
16 Function f()
17     MsgBox("I have been evaluated")
18     f = 1
19 End Function
20
21 'Main
22 Dim i
23 i = 1
24 If (i=0) AND (f()) Then
25     MsgBox("true")
26 Else
27     MsgBox("false")
28 End If
```

2) The languages Fortran, Pascal and Go used short circuit and did not evaluate the second conditional, which ran the function. Ada and VBScript did not and ran the second function.

3) While in our program, the second conditional was trivial in program execution, this is not always the case. If the second conditional had a significantly costly execution cost, skipping the second conditional could save considerable execution time.
